

# Purpose-Built Apps

The **AML Lockdown Utility** gives administrators the ability to restrict user access to only specific applications necessary to the user.

Use the **AML Barcode Service** to configure the behavior of the barcode scanner. Enable or disable symbologies, add prefixes or suffixes, change the “good read” sound, or enable AML’s “ScreenFlash” technique to provide visual confirmation of good scans or bad reads.

**AML Setup** is a device configuration software designed to expedite the AML device configuration process using a preconfigured barcode or QR code. AML Setup Console is a desktop application used to modify device settings and create different configurations.

**AML Device Manager** is mobile device management web application designed to give administrators remote accessibility to their devices. Admins can monitor individual device activity, modify device settings, and provide remote support. License purchase required following demo period.

AML’s **AppLync Browser** is a “locked-down” web browser ideally used by organizations with the intention of using web-based applications on their hardware devices in the most secure way possible. License purchase required.

**GlinkVT** for VT100 and VT220 terminal emulation is preloaded and pre-licensed on select AML devices including the Striker Mobile Computer, Dragonfly Wearable Computer, and Firebird Vehicle Mount Computer.

**BT Connect** is an app designed to connect AML wireless ring scanners with AML mobile, wearable and vehicle mount computers. The barcode scanner settings can be configured in the AML Barcode Service app. Users simply scan a barcode to connect the two devices and the settings will be applied.
